Warning & Safety Reminder

WARNING & SAFETY REMINDER

Safety must be considered a basic factor in machinery operation at all times. Most accidents are the result of carelessness or negligence. All rotating power transmission products are potentially dangerous and must be guarded by the contractor, installer, purchaser, owner, and user as required by applicable laws, regulations, standards, and good safety practice. Additional specific information must be obtained from other sources including the latest editions of American Society of Mechanical Engineers; Standard A.N.S.I. B15.1. A copy of this standard may be obtained from the American Society of Mechanical Engineers at 345 East 47th Street, New York, NY 10017 (212-705-7722).

It is the responsibility of the contractor, installer, purchaser, owner, and user to install, maintain, and operate the parts or components manufactured and supplied by *Martin* Sprocket & Gear, Inc., in such a manner as to comply with the Williams-Steiger Occupational Safety Act and with all state and local laws, ordinances, regulations, and the American National Standard Institute Safety Code.

CAUTION

Guards, access doors, and covers must be securely fastened before operating any equipment.

If parts are to be inspected, cleaned, observed, or general maintenance performed, **the motor driving the part or components is to be locked out electrically in such a manner that it cannot be started by anyone**, however remote from the area. Failure to follow these instructions may result in personal injury or property damage.

WARNING

NOTE: CATALOGUE DIMENSIONS

Every effort is made to keep all catalogue dimensions and styles current in the catalogue, however from time to time, it is necessary because of manufacturing changes to alter stock products dimensionally.

If any stock product dimension or style shown in this catalogue is critical to your application please consult factory for certification.

Prime functional dimensions are correct at time of publication, pulley types and non-functional dimensions may vary.

Couplings

Whatever You Need For Couplings *Martin* Has Them

Martin Jaw Coupling

Two Complete Lines of Jaw Couplings. One for Greater Horsepower and One for Interchangeability.

ML Type

MS Type

Martin-Flex® Coupling

Smoothly transmit power while compensating for shaft misalignment to 4°, parallel misalignment to .125" and end float to .313". The two piece flange design provides quick and easy installation and the elastomeric element absorbs shock and torsional vibration through a wide temperature range.

Martin Chain Coupling

The most complete line of Chain Couplings available in the industry.

S/B

BS

TB

Aluminum

Plastic

Martin Quadra-Flex® Coupling

A proven design which offers long life, torsional flexibility, ease of installation, and withstands misalignment, shock, and vibration.

Martin MRC® Gear Coupling

General purpose coupling for quick and easy assembly.

Martin HRC Coupling

A complete line of steel gear and plastic sleeve components.

Maintenance and Lubrication

Lubrication

No maintenance or lubrication is required, visual inspection is all that is necessary.

Flexible Tyre

Highly resilient flexible tyre cushions shock loads, smoothing out load between driving and driven machines. Enables high levels of misalignment to be accommodated.

Easy Installation

Radially split tyre facilitates easy installation and removal without disturbing driving or driven shafts.

Taper Bush

Provides a wide range of bore diameters, and enables easy assembly to shafts.

Elastomeric Compound

Available in either natural rubber or fire-resistant and anti-static chloroprene. Provides the shape and damping of the tyre.

Taper Flanges

Made from Steel material, versatile design enable easy positioning on the shafts. The clamping system prevents relative movement between flexible tyre and flange.

Tension Member

Cross piled synthetic tension member enables torque to be transmitted in either direction.

Martin-Flex® couplings provide all the desirable features of an ideal flexible coupling, including Taper Bush fixing. The **Martin-Flex®** coupling is a "torsionally elastic" coupling offering versatility to designers and engineers with a choice of flange combinations to suit most applications.

The flanges are available in either F (face) or H (hub) Taper Bush fitting or bored to size.

With the addition of a spacer flange the coupling can be used to accommodate standard distance between shaft ends and facilitate pump maintenance.

Martin-Flex® couplings can accommodate simultaneous maximum misalignment in all planes without imposing undue loads on adjacent bearings and the excellent shock-absorbing properties of the flexible tyre reduce vibration and torsional oscillation.

Martin-Flex® tyres are available in natural rubber compounds for use in ambient temperatures between -50°C and +50°C. Chloroprene rubber compounds are available for use in adverse operating conditions (e.g. oil or grease contamination) and can be used in temperatures of -15°C to +70°C. The chloroprene component should also be used when fire-resistance and anti-static (F.R.A.S.) properties are required.

SELECTION

1. Service Factor

Determine the required Service Factor from table below.

2. Design Power

Multiply the normal running power by the service factor. This gives the design power which is used as a basis for selecting the coupling.

3. Coupling Size

Refer to Power Ratings table page C-7 and from the appropriate speed read across until a power greater than that required in step (b) is found.

The size of **Martin-Flex®** coupling required is given at the head of that column.

4. Bore Size

Check for Dimensions table page C-9, C-10 that chosen flanges can accommodate required bores.

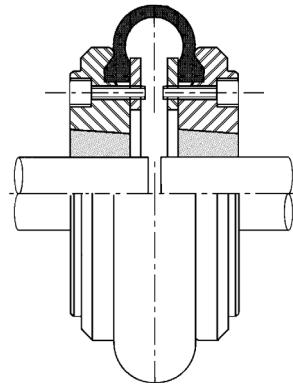

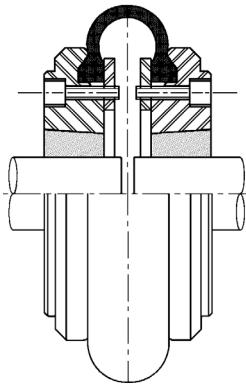

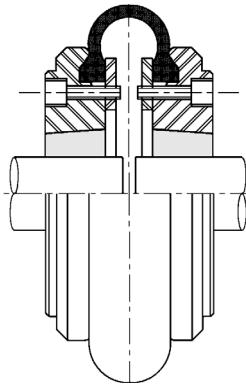

SERVICE FACTORS

Type of Driven Machine	Type of Driven Unit					
	Electric Motors Steam Turbines			Internal Combustion Engines Steam Engines Water Turbines		
	Hours per day duty		Hours per day duty		Hours per day duty	
Type of Driven Machine	10 and under	over 10 to 16 incl.	over 16	10 and under	over 10 to 16 incl.	over 16
CLASS 1 Agitators, Brewing machinery, Centrifugal compressors and pumps. Belt conveyors, Dynamometers, Lineshafts, Fans up to 7.5 kw. Blowers and exhausters (except positive displacement), Generators.	0.8	0.9	1.0	1.3	1.4	1.5
CLASS 2* Clay working machinery, General machine tools, paper mill beaters and winders, Rotary pumps, Rubber extruders, Rotary screens, Textile machinery, Marine propellers and Fans over 7.5kw.	1.3	1.4	1.5	1.8	1.9	2
CLASS 3* Bucket elevators, Cooling tower fans, Piston compressors and pumps, Foundry machinery, Metal presses, Paper mill calenders, Hammer mills, Presses and pulp grinders, Rubber calenders, Pulverizers and Positive displacement blowers.	1.8	1.9	2.0	2.3	2.4	2.5
CLASS 4* Reciprocating conveyors, Gyratory crushers, Mills (ball, pebble and rod), Rubber machinery (Banbury mixers and mills) and Vibratory screens.	2.3	2.4	2.5	2.8	2.9	3

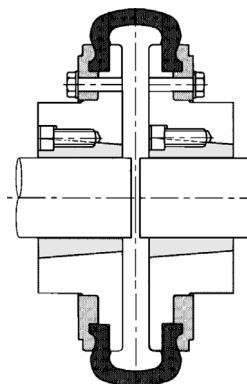

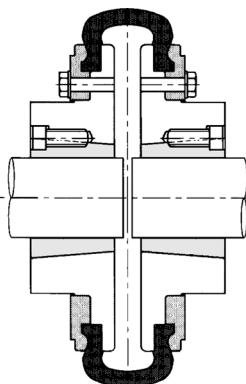

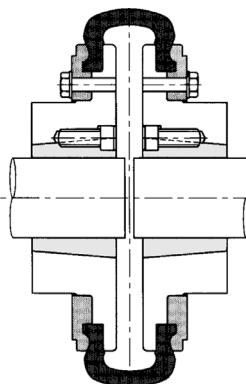

* It is recommended that keys (with top clearance if in Taper bushes) are fitted on application where load function is expected.

+ Couplings for use with internal combustion engines may require special consideration, such as a flywheel configuration. Consult for **Martin** specifications.

Dimensions in millimeters unless otherwise specified.

* G is the amount by which clamping screws need to be withdrawn to release tyre.

* R is the wrench clearance to allow for tightening/loosening the bush on the shaft and the clamping screws on sizes F40, F50 and F60.

The use of a shortened wrench will allow this dimension to be reduced.

* M is half the distance between flanges. Shaft ends, although normally located twice M apart, can protect beyond the flanges as shown.

In this event allow sufficient space between for end float and misalignment.

Mass and inertia figures are for single flange with mid range bore and included clamping ring, screws and washers and half tyre.

For pilot bore 'B' flange code is listed.

Flanges are also available finish bored with keyway if required.

Bore must be specified on order.

#Note: On sizes F70, 80, 100 and 120 the 'F' direction bush is larger than that in the 'H' 00direction.

Martin-Flex® Installation Instructions

NOTE: Satisfactory performance depends on correct installation and maintenance. Under no circumstances should any machine be started unless the coupling and associated machine is completely assembled. All instructions in this manual should therefore be followed accurately.

1. Thoroughly clean all components, paying particular attention to the removal of the protective coating in flange bores and on bushes.
2. Fit flanges to the shafts after placing the external clamp rings on the shafts. (Where Taper flanges are used, see separate fitting instructions supplied with the Taper Bushes.) Locate flanges so that dimension M is obtained (see paragraph 3). Flanges with internal clamping rings should then have the clamping rings fitted, engaging only two or three of the threads of the screws at this time.
3. Bring shafts into line until dimension M is obtained (table 2). If shaft end float is to occur, locate the shafts at mid-position of end float when checking dimension M. Note the shaft ends may project beyond the faces of the flanges if required. In this event, allow sufficient space between shaftends for end float and mis-alignment. Flanges should be fitted flush with the end of the shaft when used with Mill-Motor flanges.
4. Check parallel alignment by laying a straight edge across the flanges at several positions around the circumference. Check angular alignment by measuring gap between flanges at several positions around the

circumference. It is desirable to align the coupling as accurately as possible, particularly on high speed applications.

5. Open out tyre and fit over coupling flanges ensuring that the tyre beads seat properly on the flanges and/or clamping rings. To ensure proper seating, it may be necessary to strike the outside diameter of the tyre with a small mallet. When seated there should be a gap between the ends of the tyre as shown in Table 1.

TABLE 1

Coupling Size	F40 to F60	F70 to F120	F140 to F160	F180 to F250
Tyre Gap mm	2	3	5	6

6. Tighten clamping ring screws alternately and evenly (half turn at a time) working round each flange until the required screw torque is achieved (table 2).

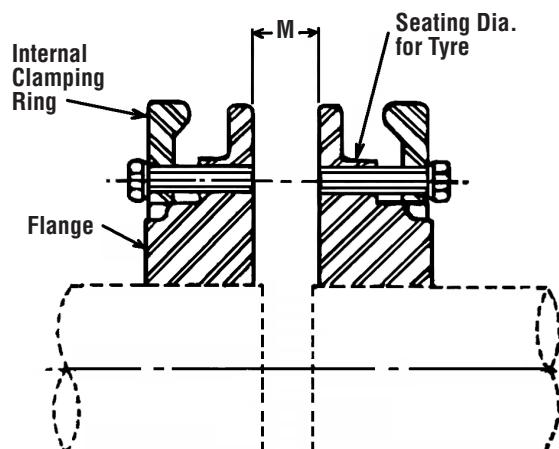

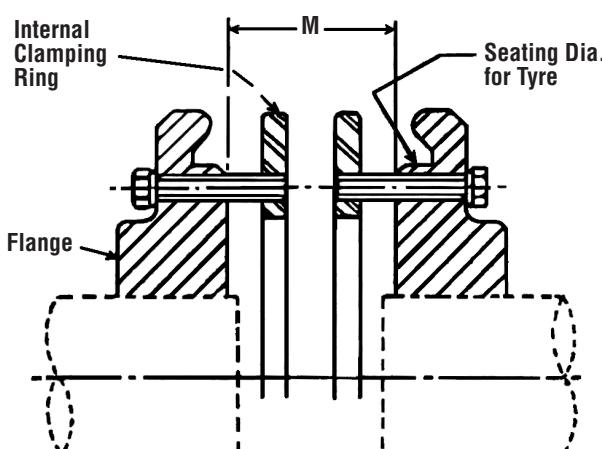

TABLE 2

Coupling Size		F40	F50	F60	F70	F80	F90	F100	F110	F120	F140	F160	F180	F200	F220	F250

Martin-Flex® flexible couplings smoothly transmit power while compensating for shaft misalignment to 4°, parallel misalignment to 3.2 and end float to 7.9. The two piece flange design provides quick and easy installation and the elastomeric element absorbs shock and torsional vibration through a wide temperature range.

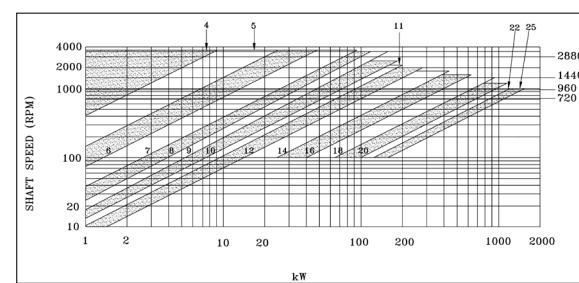

Quick Selection Procedure

1. Select the proper service factor from Chart 1.
2. Determine **Design kw** by multiplying the **Service Factor** and the **Drive kw**.
3. Locate the intercept of **Shaft Speed** and **Design kw** from Chart 2.
4. Order per coupling: (2) bushings, (2) flange assemblies, (1) flexible tire element.

Chart 2 Size Selection

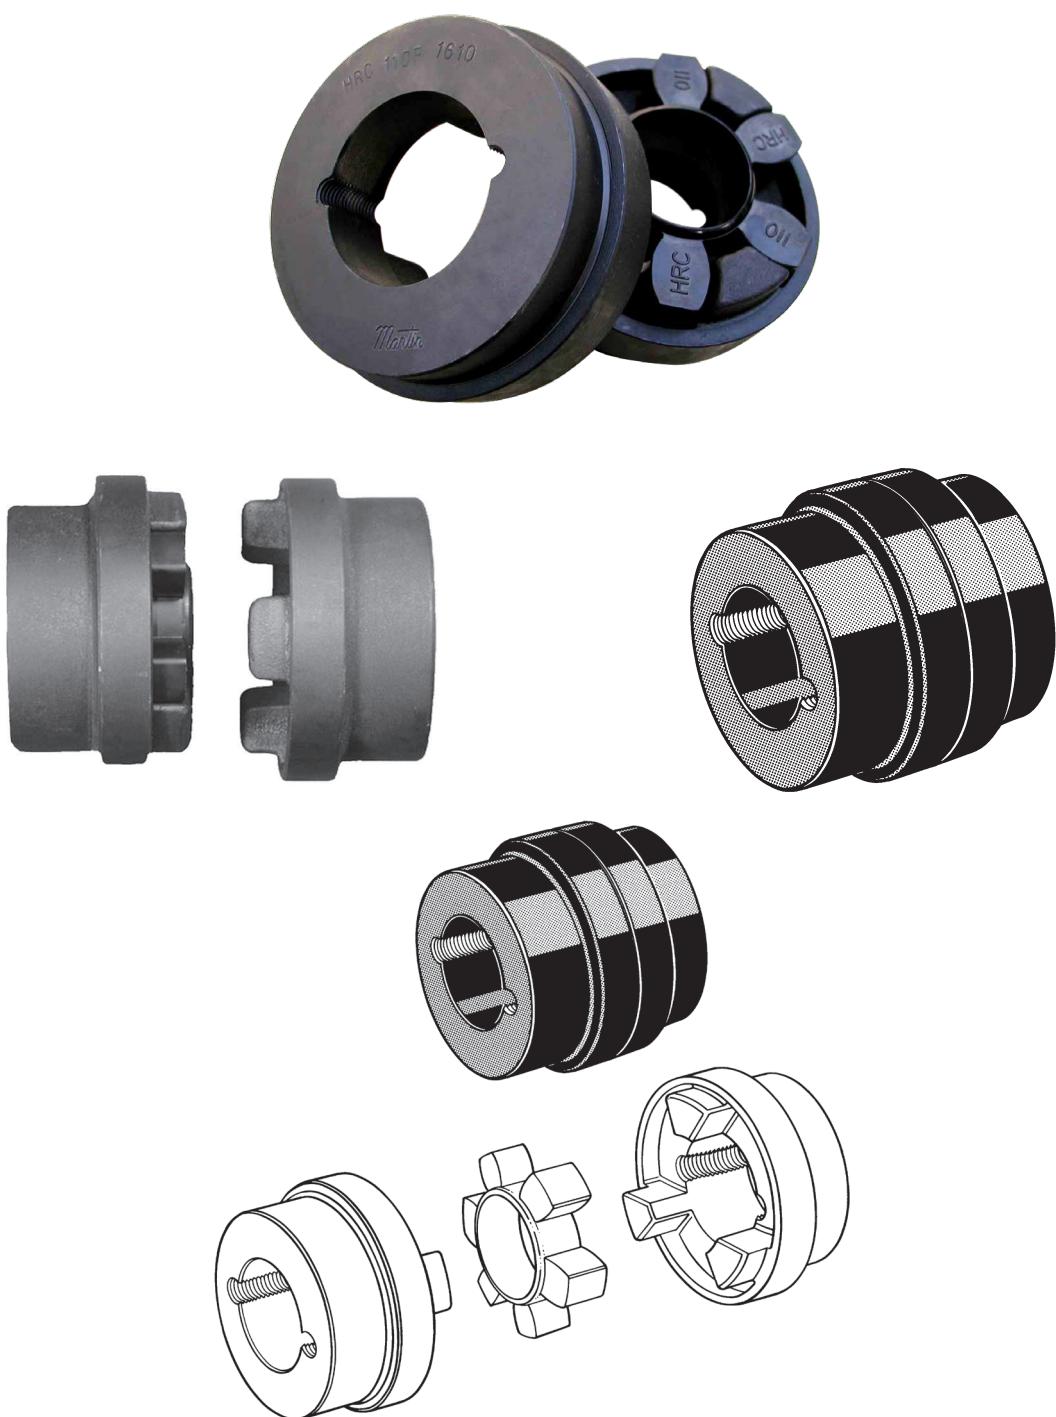

HRC Couplings

Martin

Martin's HRC COUPLINGS

Martin's HRC Couplings offer a range of hub and element selection to meet the demand for a low cost, general purpose spacer type flexible coupling. They allow for incidental misalignment, absorb shock loads and dampen out small amplitude vibrations. They are offered in both Pilot bore, Finished bore, and Taper bushed with both face and hub mount.

These semi-elastomeric couplings are designed for general purpose applications and permit quick and easy assembly by means of Taper bush. Outside diameters are fully machined to allow alignment by simple straight edge methods. Shaft connection is "fail safe" due to interacting jaw design.

SELECTION

(a) Service Factor

Determine appropriate Service Factor from table below.

(b) Design Power

Multiply running power of driven machinery by the service factor. This gives the design power which is used as a basis for coupling selection.

(c) Coupling Size

Refer to Power Ratings table below and read across from the appropriate speed until a power greater than the design power is found. The size of coupling is given at the head of that column.

(d) Bore Size

From Dimensions table (page C-16) check that the required bores can be accommodated.

EXAMPLE:

A shaft coupling is required to transmit 70kW between a 1200 rev/min diesel engine and a hoist running over 16hrs/day. Engine shaft is 70mm and the hoist shaft is 75mm.

(a) Service Factor

The appropriate Service Factor is 2.5.

(b) Design Power

Design power $70 \times 2.5 = 175\text{kW}$.

(c) Coupling Size

Reading across from 1200 rev/min in the speed column of Power Ratings table below, 251kW is the first power to exceed the required 175kW (design power). The size of the coupling at the head of this column is 230.

(d) Bore Size

The Dimensions table (page C-16) shows that both shaft diameters are within the bore range available.

SERVICE FACTORS

Driven Machine Class	Type of Driving Unit					
	Electric Motors Steam Turbines			Internal Combustion Engines Water Turbines		
	Hours per day duty		Hours per day duty		Hours per day duty	
8 and under	over 8 to 16 inclusive	over 16	8 and under	over 8 to 16 inclusive	over 16	over 16
UNIFORM Agitators, Brewing machinery, Centrifugal blowers, Centrifugal compressors, Conveyors, Centrifugal fans and pumps, Generators, Sewage disposal equipment.	1.00	1.12	1.25	1.25	1.40	1.60
MODERATE SHOCK* Clay working machinery, crane hoists, Laundry machinery, Wood working machinery, Machinery tools, Rotary mills, Paper mill machinery, Textile machinery, Non-uniformly loaded centrifugal pumps.	1.60	1.80	2.00	2.00	2.24	2.50
HEAVY SHOCK* Reciprocating conveyors, Crushers, Shakers, Metal mills, Rubber machinery (Banbury mixers and mills), Reciprocating compressors, Welding sets.	2.50	2.80	3.12	3.12	3.55	4.00

* It is recommended that keys (with top clearance if Taper bushes) are fitted for applications where load fluctuation is expected.

† For Centrifugal Compressors multiply Service Factor by an additional 1.15.

POWER RATINGS (KW)

Speed rev/min	Coupling Size

*J' is the wrench clearance required for tightening/loosening the bush on the shaft. A shortened wrench will allow this dimension to be reduced.

+ F, refers to combinations of flanges: FF, FH, HH, FB, HB, BB.

Bore limits H7 unless specified otherwise.

Dimensions in millimeters unless otherwise specified.

All HRC Elements have an angular misalignment capacity of up to 1°.

Mass is for an FF, FH or HH coupling with mid range Taper Bushes.

Note: For details of HRC couplings suitable for application to drives involving SAE engine flywheels, consult *Martin*.

Type B flanges can be supplied finished bored, with keyway if required.

Martin Offers
The *Martin* Universal — Completely Interchangeable

- No Lubrication
- Easy Installation
- No Metal to Metal Contact
- Resistant to oil, dirt, sand, moisture, grease
- Easy inspection of load carrying Spider
- Flexibility of angular or parallel misalignment of shafts by Bruna-N Spider member permits smooth "Power Transmission"

Flexible Jaw Couplings

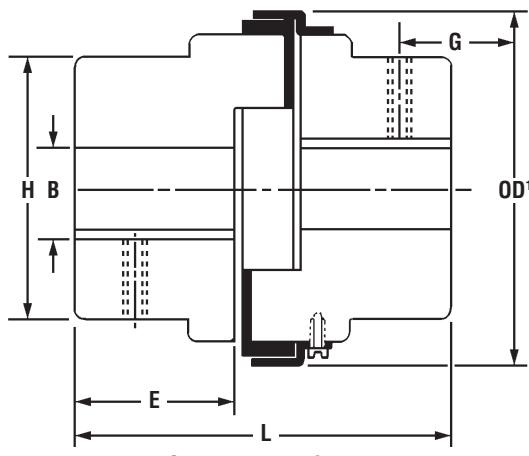

Martin

Martin Jaw Couplings offer a range of hub and element variants to meet the demand for low cost, general purpose and spacer type flexible couplings. They cater for incidental misalignment, absorb shock loads and damp out small amplitude vibrations.

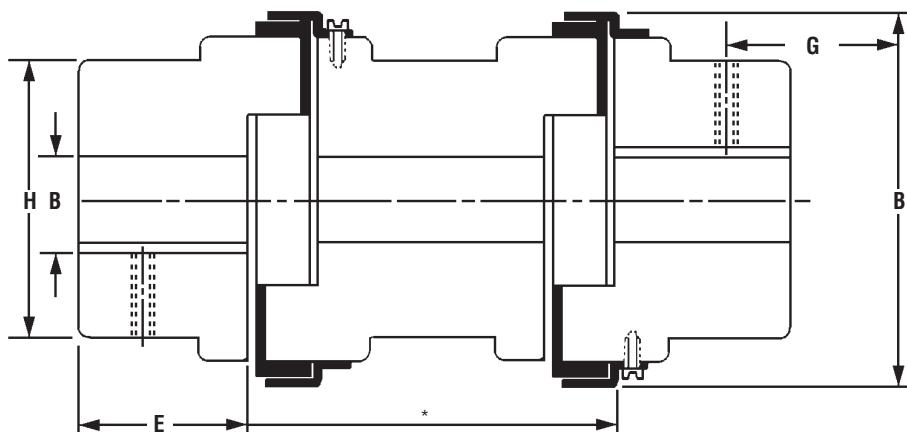

HUBS & SPACERS

SX (2 hubs plus spider element)

QF (2 hubs plus QF ring kit)

dbse — 100mm or 140mm
QFS (2 hubs plus QF ring kit plus QFS spacer kit)

DIMENSIONS: SX, QF AND QFS

Dimensions in millimeters unless otherwise specified.

† Mass of complete SX or QF type with pilot bore hubs

Bored or bored and keywayed hubs can be supplied.

Hub material is high grade cast iron.

Spacer material is aluminum.

dbse = distance between shaft ends.

* Bored or bored and keywayed hubs can be supplied in SX and QF styles.

Bores are to ISO 268 H7 tolerance (BS 4500; 1969). Keyways are to BS 4235 for metric bores and to BS 46 Pt 1 : 1958 for Imperial bores.

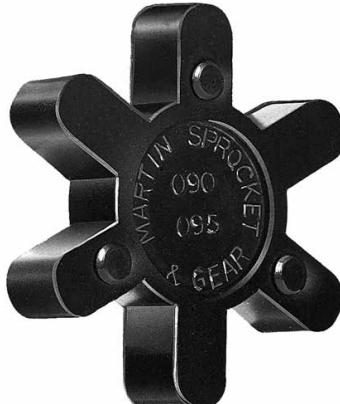

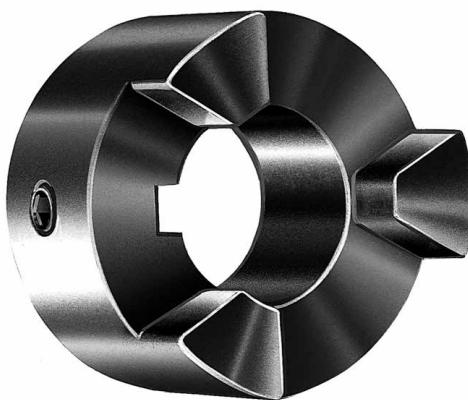

Jaw Coupling Selection Procedure

A. Determine Service Factor by Matching Driven Unit with Prime Mover in Service Factor Guide.

B. Multiply Service Factor by Driven Unit or Motor KW to Obtain Adjusted KW.

C. Select Flexible Coupling with Horsepower Capacity Equal to or Greater than Adjusted KW.

Service Factor Guide		Prime Mover		
Driven Unit (Machinery)		Electric Motor or Steam Turbine	Gasoline or Diesel Engine, 6 or More Cyl.	Gasoline or Diesel Engine, Less Than 6 Cyl.
Light: Uniform or steady load never exceeding horsepower rating, infrequent starting. Agitators, Blowers, Conveyors, Evaporators, Fans, Generators, Centrifugal Pumps, Stokers		1.0	1.5	2.0
Moderate: Heavy inertia, moderate shock, frequent starting; peak loads do not exceed 125 per cent average horsepower. Uneven load. Beaters, Rotary Pumps and Compressors, Cranes, Elevators, Mine and Propellor Fans, Generators, Pulp Grinders, Hoists, Kilns, Machine Tools, Mixers, Gear Pumps, Woodworking Machines		1.5	2.0	2.5
Heavy: Heavy shock conditions or frequent reversing. Peak loads do not exceed 150 per cent average horsepower. Uneven load. Reciprocating Pumps and Compressors, Crushers, Freight and Passenger Elevators, Mills (Hammer, Ball, Rolling, Turf, Flour), Vibrating Screens, Winches, Wire Drawing Machines, Punches, Shears		2.0	2.5	3.0

Bore Tolerances: = H7

* When using Hytex or Bronze spider multiply above horsepower ratings by 3.

† When using Urethane spider multiply above kW ratings by 1.5.

Metric & Imperial
Bore Sizes Available

ML Type Couplings

ML Type couplings range in size from 035 to 225. The coupling design provides for a collar to be attached to our hub shielding the snap wrap spider. Ordering requires selecting Item (UPC) numbers for one standard ML type hub (without collar attachment), one standard snap wrap center insert and one collar with screws.

Jaw Couplings

Martin

ELEMENTS

Type	Temperature Range (°C)	Max Misalignment		Power Factor
		Ang°	Par. (MM)	
Nitrile (Spider)	-40 to 100	1	0.38	1
Nitrile (QF)	-40 to 100	1	0.38	1
Urethane	-35 to 70	1	0.38	1.5
Hytrel®	-50 to 120	.50	0.38	3*

4th digit = Alpha character for coupling size

SELECTION

- Find Service Factor for application from table right.
 - Multiply normal running power by Service Factor.
 - Select a standard nitrile element coupling size from Power Ratings table below by reading across from the appropriate speed until a power equal to or greater than the design power is found. Coupling size is at the head of the column.
 - For alternative elements multiply the design power from step (b) by the Element Power Factor in table above and repeat step (c) with the new design power.
 - For speeds other than those listed use the nominal torque ratings from the Power Ratings table below.
- Required Torque (Nm) = $\frac{\text{Design power (kw)} \times 9,555}{\text{rev/min}}$
- Check for the hub Dimensions tables that bore capacity is adequate for the coupled shafts.
 - Orders for complete couplings should give part numbers for hubs, elements and spacers separately.

Taper Bush Rigid Couplings provide a convenient method of rigidly connecting ends of shafts. Taper Bushes permit easier and quicker fixing to the shafts with the firmness of a shrunk-on-fit. These couplings

have a male and female flange fully machined. The male flange can have the bush fitted from the Hub side H or from the Flange side F, the female flange always has the bush fitting F. This gives two possible coupling

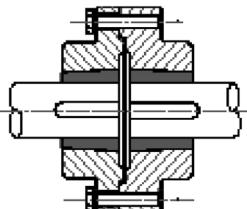

assemblies horizontal shafts, the most convenient assembly should be chosen. **When connecting vertical shafts use assembly FF only.**

SELECTION

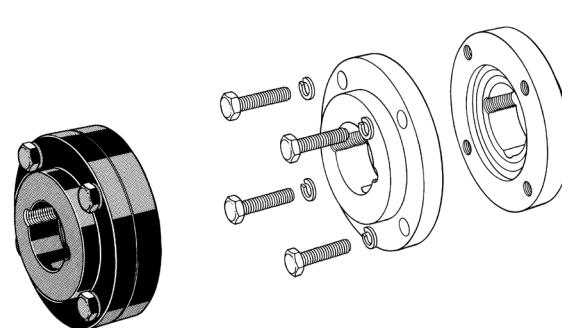

For all applications using standard mild steel shafting it is sufficiently accurate to select the coupling by consideration of bore size alone. For all other applications consult *Martin*.

Coupling Installation

Martin

SHAFT ALIGNMENT

Appropriate alignment of the coupled shafts (or driven shaft to flywheel) is a fundamental requirement for any coupling installation.

The three basic modes of shaft misalignment are shown right.

Composite i.e. more than one mode, misalignment is available for some couplings (detailed elsewhere in this catalog).

Details of the degrees of misalignment that can be accommodated by different types and sizes of coupling which are given throughout this catalog.

With some couplings, axial shaft orientation (DBSE) is not critical, whereupon coupling component orientation (given as an 'assembled length' or 'distance between faces') becomes crucial.

Excepting Universal Joints under angular misalignment, it should be remembered that misalignment can cause extra loading on coupled shaft support bearings and can reduce the operational life of some couplings. Best practical alignment is therefore desirable. Taper Bush Rigid Couplings cannot accommodate misalignment.

OTHER CRITERIA

Martin-tyre gap and seating. Tyre/element clamping bolt torque.

HRC - do not use to couple resiliently mounted machinery.

All Elastomeric Couplings - consider ambient conditions (FRAS or other alternative element material required?)

All Taper Bush Couplings - bush grips the shaft first and draws hub on to taper. This may affect axial alignment.

All applications - ensure shaft diameter tolerances are correct.

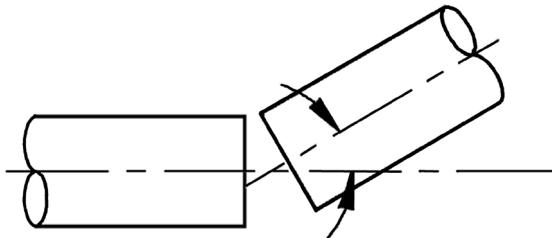

NOTE **Martin**-Flex elements are accompanied by detailed installation data.

TAPER BUSH

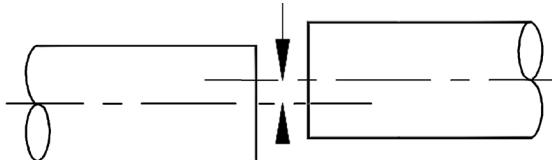

Most of the **Martin**-Flex and HRC couplings, and all Rigid couplings featured in this section use Taper Bushes. For detailed instructions on the fitting and dismounting of Taper Bush products see Bushing Installation on page B-15.

Note: When fitting Taper Bush coupling flanges it should be noted that the bush grips the shaft initially and draws the flange up the tapered surface.

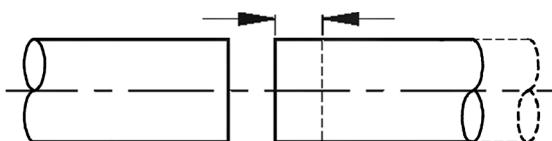

This may have a small effect on the final axial positioning of flanges on machine shafts, and the resultant distance between coupling flanges, where this is important to the fit and function of flexible coupling elements.

ANGULAR MISALIGNMENT - Shafts are at an angle to one another

PARALLEL MISALIGNMENT - Shafts are in line angularly and parallel to each other, but are off-set.

AXIAL MISALIGNMENT - includes applicable 'end float' - shafts move axially increasing or decreasing the distance between shaft ends.

SC Spacers

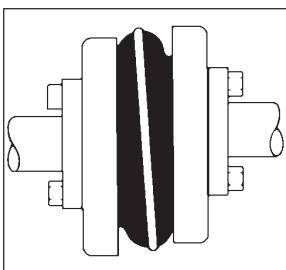

QUADRA-FLEX® 4-Way Flexing

Martin

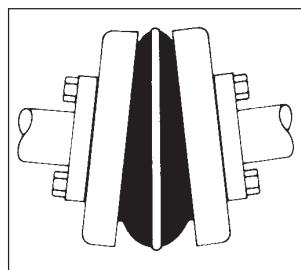

Martin QUADRA-FLEX® Couplings, Non Lubricated,
Maintenance Free, Easy and Quick Installation

Handles All Combinations of Shock, Vibration, and Misalignment

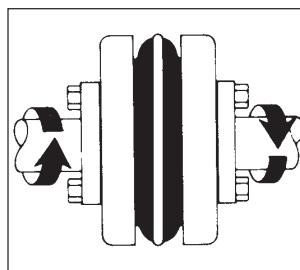

Parallel

QUADRA-FLEX® couplings absorb parallel misalignment without wear and with minimal loss of energy. The amount of parallel offset handled varies by size from 0.4mm on the size 5 up to 1.6 mm on the size 16. This minimizes the radial loads on bearings when parallel misalignment occurs.

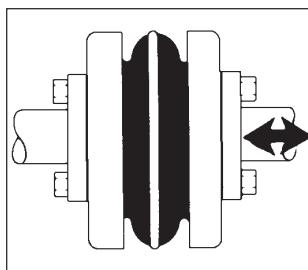

Angular

Due to the flexing characteristics of the sleeve and the locking action of the teeth, QUADRA-FLEX® couplings easily handle angular misalignment up to 1 degree without any appreciable wear.

Torsional

QUADRA-FLEX® sleeves are torsionally resilient and are well suited to absorbing shocks and dampening vibrations that would otherwise be transmitted between the equipment.

Axial

The axial flexibility of the sleeve allows the QUADRA-FLEX® coupling to accept a limited amount of end float. This serves to reduce thrust loads transferred to bearings. QUADRA-FLEX® units will accept axial movement of approximately 3.2mm.

Available in Three Styles

Type J and S Flanges

Bored-to-size flanges are manufactured for a slip fit on standard shafting. Available from stock in a wide range of shaft sizes.

Type B Flanges

Manufactured from high strength cast iron to fit standard QD bushings in sizes 6 thru 16.

Fast Coupling Disassembly

Martin offers the first true drop-out spacer assembly for the 4JSC spacer coupling. The center portion of the spacer can be taken out, just as in the 5SC thru 14SC, by simply removing four cap screws in each hub. The couplings center section can then be lifted out and the pump gaskets exposed. Flats on the spacer hubs facilitate turning shafts with a wrench.

Type SC Spacer Flange

QUADRA-FLEX® SC Spacer Couplings feature all standard spacing requirements for the pump industry. Spacer sizes range from sizes 4 thru 14.

Sleeve Selection

QUADRA-FLEX® Nomenclature

Flanges

Type	Description
J ★	SINTERED STEEL, BORE-TO-SIZE
S	CAST IRON, BORED-TO-SIZE

SC	SPACER COUPLING FLANGES

★ — #6 Currently Supplied in Cast Iron

Hubs – (For SC flanges)

Type	Description
H	REGULAR LENGTH
HS	SHORT LENGTH

QUADRA-FLEX® couplings come in a variety of styles and designs to meet specific customer needs. These include flanges and sleeves of various types and materials. The total product line includes 13 sizes varying in torque ratings up to 8135 Nm.

When ordering QUADRA-FLEX® couplings, the following basic procedure should help expedite order processing. For coupling flanges, give the basic coupling size, then the letter for the type flange followed by the bore size required. For coupling sleeves, give the coupling size followed by the letter(s) designating the type and material required. (See above)

The following are various examples for reference:

Example: Type J Flange

	Size	Flange	Bore
5J x 19.1 mm	5	J	19.1mm
7S x 30mm	7	S	30mm

(Note: Bored-to-size flanges are furnished with standard keyway and 2 setscrews unless specified otherwise.)

Sleeves

Type	Description
JEM	TPR – 1-PIECE SOLID, THERMOPLASTIC
JEMS	TPR – 1-PIECE SPLIT, THERMOPLASTIC
EM	TPR – 2-PIECE W/RETAINING RING
E	EPDM – 2-PIECE W/RETAINING RING
N	NEOPRENE – 2-PIECE W/RETAINING RING
H	HYTREL – 1-PIECE SOLID
HS	HYTREL – 2-PIECE

Example: Type B Flange

8B — SH	Size 8	Flange B	Bushing SH
---------	-----------	-------------	---------------

(Note: The SH bushing with required bore size should be specified separately.)

Example: Sleeves

	Size	Style & Material
8JEM	8	Solid, TPR
11E	11	2 Piece, EPDM

(Note: Unless specified, TPR (3 thru 10) or EPDM (11 thru 16) will be supplied.)

Example: Complete spacer coupling

1	6EM	(6 TPR 2 Piece Sleeve)
2	6SC35	(Flanges for 88.9mm dropout)
1	6H x 25.4mm	(6 Spacer Hub for 25.4mm Bore)
1	6H x 28.6mm	(6 Spacer Hub for 28.6mm Bore)

QUADRA-FLEX® coupling sleeves are available in four different types of compounds. These include TPR (ThermoPlastic Rubber) in types JEM, JEMS, EM; EPDM

Rubber in type E; Neoprene in type N; Hytrel in type H and HS. To determine the sleeve best suited for the application, the material characteristics are given below.

TPR

(Sizes 3-10)

QUADRA-FLEX® couplings are usually supplied with TPR sleeves in sizes 3-10. TPR is a general use sleeve which combines the characteristics of both EPDM & Neoprene into one. These sleeves operate within a temperature range from -46°C to +135°C. (-50°F to + 275°F) Torsional flexibility is 15°.

EPDM

(Sizes 11-16)

QUADRA-FLEX® couplings are usually supplied with EPDM rubber sleeves in sizes 11-16. EPDM is a general use sleeve and can operate within a temperature range from -34°C to +135°C. (-30°F to + 275°F) Torsional flexibility is 15°.

NEOPRENE

(Sizes 13-16)

Neoprene flexible sleeves are also available in sizes 11-14. These sleeves offer a higher resistance than EPDM and are self-extinguishing. Operating temperature range for this sleeve is -18°C to +93°C. (0°F to + 200°F) Torsional flexibility is 15°.

* HYTREL®

(Sizes 6-14)

Hytrel sleeves are molded specifically for high torque applications. The type H will transmit approximately four times as much power as an equivalent TPR, EPDM, or Neoprene sleeve. Hytrel has an operating temperature from -54°C to +121°C. (65°F to + 250°F) Torsional flexibility is 7°.

Note: Do not use a Hytrel sleeve as a replacement for a TPR, EPDM, or Neoprene sleeve.

Selection Procedure

Selection Procedure

When the driver is an electric motor with standard speed.

Step 1. Determine Service Factor (SF) Symbol based on equipment listed in Table 1 on page C-31.

Step 2. Determine proper Service Factor from chart at top of page C-31.

Step 3. Refer to page C-33 and C-34 for proper selection of coupling. Based on chemical resistance and operating environment found on page C-29, select from chart the type of sleeve material. Find RPM of motor, then, in the column for service factor determined in Step 2, read down to the corresponding kilowatt power of motor being used as the driver. The number listed is the correct coupling size.

Example: A coupling is needed to connect a 18.5 kW standard electric motor to a lumber log haul at 1450 RPM.

1. Service Factor Symbol — H
2. Service Factor — 2.0
3. Coupling Size — 10 with TPR sleeve or 6 with Hytrel Sleeve

Step 4. Select flanges from pages C-14 thru C-16, check coupling bore size range for proper shaft fit.

★ NOTE: Do not oversize coupling hub — will cause premature wear of element.

When the driver is other than an electric motor or the speeds are different than those shown in the chart on pages C-29 and C-30.

Step 1. Follow steps 1 & 2 in previous procedure.

Step 2. Calculate kW at 100 RPM as follows:

$$kW \text{ at } 100 \text{ RPM} = \frac{kW \times \text{Service Factor} \times 100}{\text{coupling RPM}}$$

Step 3. Select coupling size from Table 2. Find a HP equal to or greater than the kW/100 RPM

Step 4. Check Maximum bore to be sure that both shaft sizes do not exceed figure listed for size selected in step 4. If maximum is exceeded select the next largest size which will allow for bore size. Do not exceed maximum RPM for new size selected.

Example: A bucket elevator is driven by a motor/reducer and requires a coupling to transmit 10.4 kW at 1300 RPM.

1. Service Factor Symbol — M
2. Service Factor — 1.5
3. kW at 100 RPM = $\frac{10.4 \times 1.5 \times 100}{1300} = 1.20 \text{ kW/100 RPM}$

4. Refer to page C-32; under column for 100 RPM the required 1.20 kW falls between the size 7 (0.89) and the size 8 (1.30). Correct selection is size 8 with TPR sleeve. Check bore sizes for flanges on pages C-36 thru C-37.

Maximum RPM and Allowable Misalignment

Size	Maximum RPM	Types JEM, JEMS, EM, E and N		Types H and HS	
		Parallel	Angular	Parallel	Angular
3	9200	.010	.035	—	—
4	7600	.010	.043	—	—
5	7600	.015	.056	—	—
6	6000	.015	.070	.010	.016
7	5250	.020	.081	.012	.020
8	4500	.020	.094	.015	.025
9	3750	.025	.109	.017	.028
10	3600	.025	.128	.020	.032
11	3600	.032	.151	.022	.037
12	2800	.032	.175	.025	.042
13	2400	.040	.195	.030	.050
14	2200	.045	.242	.035	.060
16	1500	.062	.330	—	—

Note: Values shown above apply if the actual torque transmitted is more than $\frac{1}{4}$ inch the coupling rating.
For lesser torque, reduce the above values by $\frac{1}{2}$ inch.

QUADRA-FLEX® Sleeves

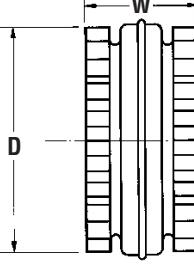

Martin flexible sleeve elements are offered in four material compounds (ThermoPlastic Rubber (TPR), EPDM, Neoprene, and Hytrel) available in three construction styles. Our EM sleeve offers the combination of EPDM's extended temperature range as well as the higher oil resistance which Neoprene provides.

Type JEM

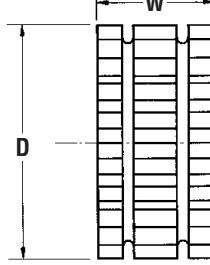

Type JEMS

Type EM, E, and N

Type H

Type HS

Types JEM — JEMS

Type J sleeves are molded ThermoPlastic Rubber (TPR). Available in 1 piece solid (JEM), and 1 piece split, construction (JEMS). TPR material will handle higher temperature ranges as well as be oil resistant.

Types EM — E — N

Type EM, E, and N sleeves are of two piece molded construction with Retaining Ring. They are available in ThermoPlastic Rubber (Type TPR), EPDM (Type E), or Neoprene (Type N). These can be used with any type flanges within a given size range.

Types H & HS

Martin H & HS sleeves are molded Hytrel for higher torque loading than standard EM sleeves. H & HS sleeves cannot be used with style J and B flanges. Hytrel sleeves are not a direct replacement for TPR, EPDM, or Neoprene sleeves.

• 13 & 14 Hytrel available with HS sleeves only.

Type J Flanges

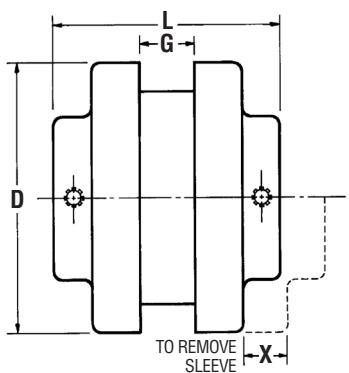

QUADRA-FLEX® Type J Flanges

QUADRA-FLEX® Type J Flanges

Martin Type J Flanges are supplied bored to size with standard keyway and two setscrews to slip fit on standard shafting.

Type J Flanges use the *Martin* JEM 1 Piece, the *Martin* JEMS 1 piece split and the *Martin* EM 2 piece split sleeves.

Note: Hytrel sleeves are not intended for use with this type of flange.

QUADRA-FLEX® Type S Couplings (Bored to Size)

Type S flexible coupling flanges are bored to size to fit on any standard shaft. They are produced from high strength cast iron. Units are easy to install and remove and are stocked in a wide range of bore sizes as shown on the next page.

Between-Shaft Spacings

Martin

QUADRA-FLEX® Between-Shaft Spacings

Spacer couplings are available with the most popular between shaft dimensions. Spacings other than standard can be achieved by mixing flanges. The "Standard" column provides spacings using identical

flanges; the "Combination" column provides spacings with mixed flanges; the column headed "Semi-Spacer" uses one flange that is not made for spacer coupling and therefore does not have a detachable hub.

★ Check individual coupling size for flange availability.

★★ Non-Stock

NOTE: Other combinations available — consult factory.

Martin QUADRA-FLEX® flanges (hubs) and elastomeric elements (sleeves) come in a wide range of sizes and types. First, determine the size and type of coupling components required. Remove all components from their boxes and loosely assemble the coupling. **Do not install the wire ring on the two piece sleeves at this time.** Check maximum RPM values in table against operating speeds.

Martin EM sleeves are rated the same as other EPDM and Neoprene sleeves, and may be used interchangeably; however, Hytrel sleeves are rated at different values and may not be interchanged with **Martin** EM sleeves, or the EPDM and Neoprene sleeves. Check horsepower and torque ratings when selecting Hytrel sleeves.

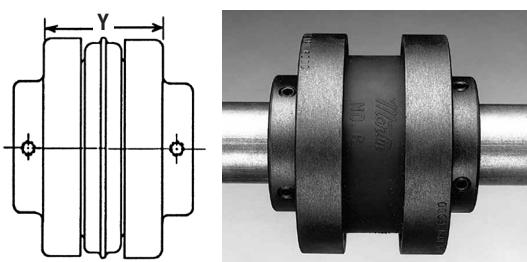

Step 1. Make sure the motor driving the part or components is locked out electrically in such a manner that it cannot be started by anyone, however remote from the area. The same type of lockout procedure applies to any other driving device which may be used. Failure to follow these instructions may result in personal injury or property damage.

Step 2. Prepare shafts for coupling installation. Inspect all coupling components and remove any protective coating or lubricants from bores, mating surfaces, and fasteners.

Step 3. Slide one coupling flange onto each prepared shaft using key stock where required. With the QD Type B flange, it may be necessary to expand the QD bushing bore for ease of installation.

Step 4. Position the flange on the shafts to achieve the approximate "Y" dimension (distance between flanges) shown in table. It is best to have equal shaft length into each flange. Tighten one flange in position, and slide the other flange sufficient distance back to install sleeve. Do not install wire ring on two piece sleeve in its final position at this time, but allow it to hang loosely in groove next to teeth.

Step 5. Slide loose flange on the shaft until the sleeve has seated completely in teeth of both flanges. Refer to "Y" dimension although not a critical dimension. Secure the flange to shaft and torque set screws and cap screws to correct torque values.

Parallel

Angular

Step 6. Check parallel alignment by placing a straight edge across the two coupling flanges and measure the maximum offset at several points around the periphery of coupling. **Do not** rotate coupling when taking these measurements. Refer to table for maximum allowed offset of parallel alignment. Realign the coupling if necessary.

Step 7. Check angular alignment with a micrometer, vernier, or caliper. Take measurement from outside to outside of flanges at several points around the periphery of coupling. **Do not** rotate coupling when taking these measurements. Determine the difference between maximum and minimum dimensions and check to make sure they do not exceed the angular figure on the table. If a correction is necessary, recheck parallel alignment.

Maximum RPM and Allowable Misalignment (Dimensions in MM)

Sleeve Size	Max. RPM	Type JEM, EM, E and N			★ H & HS		
		Parallel	Angular	Y	Parallel	Angular	Y
3	9200	0.3	0.9	30.2	-	-	-
4	7600	0.3	1.1	38.1	-	-	-
5	7600	0.4	1.4	49.2	-	-	-
6	6000	0.4	1.8	61.9†	0.3	0.4	63.5
7	5250	0.5	2.1	65.1	0.3	0.5	66.7
8	4500	0.5	2.4	74.6	0.4	0.6	76.2
9	3750	0.6	2.8	88.9	0.4	0.7	90.5
10	3600	0.6	3.3	102.9	0.5	0.8	104.8
11	3600	0.8	3.8	123.8	0.6	0.9	125.4
12	2800	0.8	4.4	144.5	0.6	1.1	146.1
13	2400	1.0	5.0	169.9	0.8	1.3	169.9
14	2200	1.1	6.1	196.9	0.9	1.5	198.5
16	1500	1.6	8.4	260.4	-	-	-

NOTE: Values shown above may apply if the actual torque transmitted is more than $\frac{1}{4}$ the coupling rating. For lesser torque, reduce the above values by $\frac{1}{2}$.

★ Type H & HS sleeves should not be used as direct replacements for JEM or EM sleeves.

† Value when using 6J flanges is 54mm.

Step 8. If the coupling employs the two-piece sleeve with wire ring, install ring in center groove of sleeve.

Note: Some force may be required to seat the ring in groove.

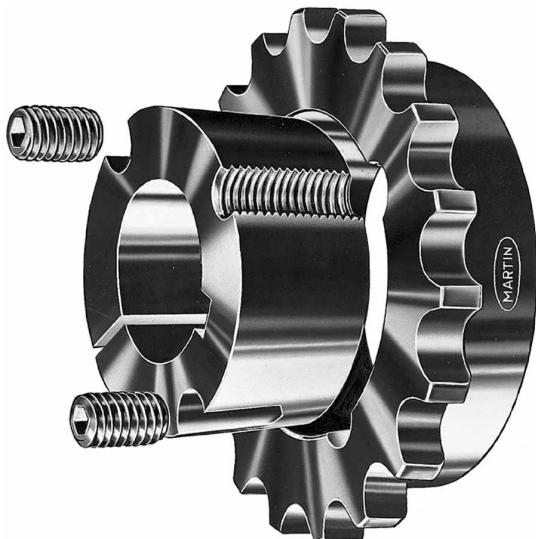

Step 9. Install protective guards and/or shields per OSHA and any other additional local or state safety codes as required. (See Warning and Safety Reminder at beginning of Section 2.)

WARNING: Coupling sleeves may be forced from coupling when subjected to a severe shock load or abuse.

Coupling Selection

Roller chain couplings have a torque capacity in excess of the torque normally transmitted by shafting which falls within the coupling bore range. Select the smallest coupling which will accommodate both shafts. For a reversing operation, shock or pulsating loads, or other severe operating conditions, select the next larger coupling size.

A cover should be used to assure maximum service life, particularly if the coupling operates at high speeds or under moist conditions. For proper lubrication, fill the space between the cover and the coupling with soft to medium consistency coupling grease.

Coupling With Plain Bores for Reboring

Coupling Number	Maximum Bore (MM)	Minimum plain bore (MM)	Weight (Kg.)	Recommended Maximum RPM	Coupling Chain Number	Weight (Kg.)

Dimensions in millimeters unless otherwise specified.

Stock Coupling Covers

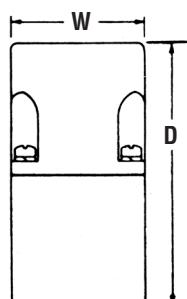

Covers fit Taper Bushed, Stock, and Finished Bore Couplings. Covers allow excellent lubrication, and their use is recommended to obtain maximum coupling life. Covers are of aluminum and Plastic and are made in halves for easy installation. Synthetic rubber oil seals, which contact the coupling hubs, retain the lubricant and prevent the entry of dirt. Covers are fitted with gaskets between the halves.

All Martin couplings have hardened teeth.

MRC® Gear Coupling

Martin's Gear Couplings provide a low cost alternative in applications where low power requirements are used. They provide an excellent way to compensate for axial, radial and angular misalignment of connecting shafts.

Pilot Bore and Finished Bore

MRC® Gear Couplings

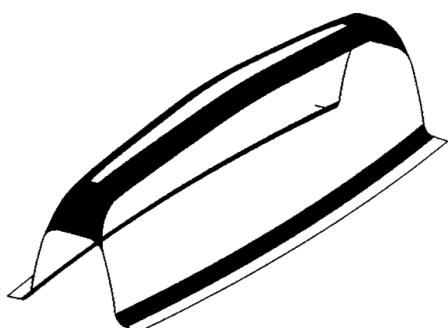

Martin

- Compact and lightweight design
- High Torque
- Power Ratings from .37kW — 450kW
- 82°C Continuous ambient operating temperature
- Split fit and Blind assembly
- Minimum shaft gap
- No metal to metal contact — electrically isolated
- No seals or retainers to maintain
- No lubrication
- Resists most contaminating elements
- Stocked in a wide range of bore sizes

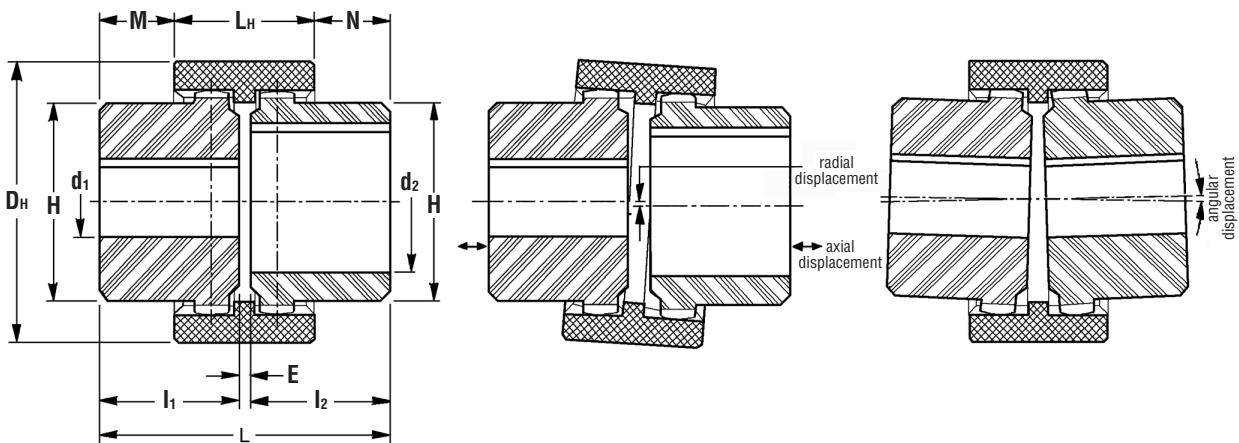

Double cardinal curved tooth with unique, smooth rounded profile

Gear Coupling

- Double cardanic curved tooth
 - residual force due to axial-radial and angular misalignment is minimized;
- Full machined tooth
 - symmetrical and even tooth form maximize performance of double cardan action between coupling components,
- Unique and smooth rounded tip relief profile,
 - higher torque transmission under misalignment conditions,
 - prevent stress raising on the plastic component to ensure smooth, low friction rotation;
- Low weight and minimum dimensions
 - easy assembling in limited space;
- Available from stock with H7 fit, standard keyway finish-bores.

55	15	55	270	2344	540	4686		± 0.5		4800
65	15	65	380	3298	760	6596		± 0.5		4000

* Nominal Torque ratings will allow for 82°C (180°F) ambient, full misalignment and/or maximum RPM

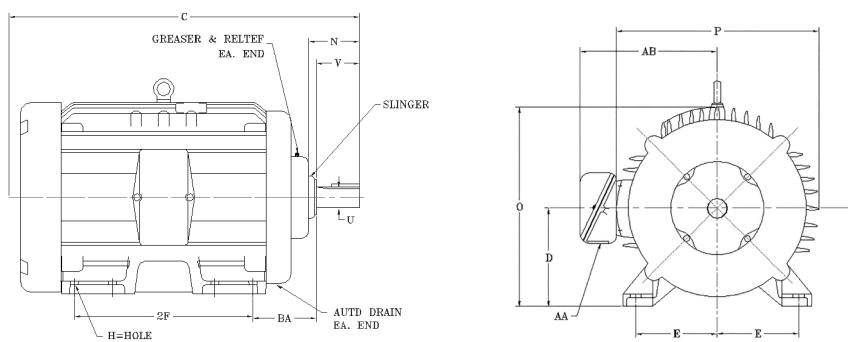

* Transient, intermittent peak loads should not exceed 3 times nominal torque

† Starting torque and breaking loads should not exceed listed maximum torque

† Applications with properly aligned shafts, low speeds and uniform loading will permit operation at maximum torque levels

ASSEMBLY

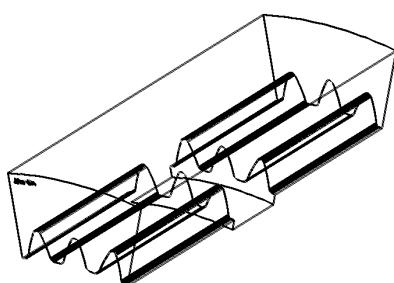

1. When possible, hubs should be mounted flush with the end of the shaft.
2. Maintain recommended shaft gap whenever possible.
3. After assembly, check coupling length.
4. After final assembly, check to make sure the sleeve moves freely in an axial direction.

Polyamide resin transmission ring with low friction glossy surface

Gear Coupling

- Outer polyamide resin sleeve is manufactured from semi-crystalline engineering polymer with high molecular weight by injection moulding;
- Mould with high polishing allow low friction rotation;
- Smooth rounded tooth bottom minimize notching stresses;
- Tip relief on tooth allow smooth gearing;
- Small size, weight and low inertia;
- Silent operation and elastic absorption of shocks and vibration;
- Resistance to most common chemical agents and also to moderate heat;
- Maintenance-free due to self-lubrication of plastic material;
- Axial plug-in for easy assembling;
- Operating range -25°C to + 100°C

We also supply *Martin* Blue-Flex® Grid Couplings, *Martin* Gear Couplings, *Martin* Go-Flex® Flexible Couplings and *Martin* New HRC Couplings. Call *Martin*, we will be happy to assist you!
